WoodStraw™ Wood Strand Erosion Control Mulch

USFS – R6 – Mt Hood National Forest – Zigzag Ranger District – November 2006

...in the fall of 2006 we used WoodStraw™ for erosion control on two projects. The first was on newly cleared (logged) downhill ski runs associated with a new lift at approximately 5000 feet on the south side of Mount Hood. The second project was associated with a new trail system in the vicinity of Government Camp Oregon. On this project the WoodStraw™ was used in the riparian area to stabilize new bridge crossing sites. Reviews of the product on both sites were very favorable. Folks liked the small bale size, the ability to easily spread the material even when the bale was wet (unlike straw which clumps together), and the lack of allergen's associated with hay and mold.
